Abstract This is the second part of the new evaluation of atomic masses, AME2020. Using least-squares adjustments to all evaluated and accepted experimental data, described in Part I, we derived tables with numerical values and graphs which supersede those given in AME2016. The first table presents the recommended atomic mass values and their uncertainties. It is followed by a table of the influences of data on primary nuclides, a table of various reaction and decay energies, and finally, a series of graphs of separation and decay energies. The last section of this paper provides all input data references that were used in the AME2020 and the NUBASE2020 evaluations.

Keywords: atomic mass evaluation, atomic mass table, separation and reaction energies, trends from the mass surface

1 Introduction

In this paper, tables with numerical values and graphs derived from the evaluation of the input data given in Part I [1] are presented.

Firstly, we present a table that contains the values of atomic masses and their uncertainties (Table I), followed by a table containing the influences for primary nuclides (Table II) and a table of twelve reaction and decay energies (Table III).

The tabular information is followed by a series of graphs that include the two-neutron separation energies and total α-decay energies as a function of the neutron number, and the two-proton separation energies as a function of the proton number.

Finally, references of the input data used in the AME2020 [1] and the NUBASE2020 [2] evaluations are given at the end of this article.

2 Atomic mass table

Table I presents the atomic masses expressed as mass excess in keV, together with the binding energy per nucleon, the beta-decay energy and the total atomic mass in the unified atomic mass unit, similar to those published in the earlier AME editions [3–9]. Traditionally, the masses of nuclides are measured for electrically neutral atoms or single-charged ions. At present, the highest precision masses are measured using Penning traps for a single-charged ion. This is the main reason why atomic masses, rather than nuclear masses, are presented in the AME.

In general, the nuclear masses M_N can be calculated from the atomic ones M_A as:

$$M_N(A,Z) = M_A(A,Z) - Z \times m_e + B_e(Z), \qquad (1)$$

where B_e(Z) is the electron binding energy. The ionization energy is generally (much) smaller than the uncertainty of the mass and, for a small number of very precise mass measurements, corrections for the first- and second-ionization potentials can be applied without much loss of accuracy. The same is true for the electron mass, m_e; see Table A in Part I [1].

Nowadays, several mass measurements are conducted with fully or almost fully ionized atoms. In such cases,

a correction must be made for the total binding energy of all the removed electrons $B_e(Z)$. Unfortunately, the precision of the calculated $B_e(Z)$ values is not well established, since this quantity (approximately 760 keV for $_{92}$U) cannot be easily measured. However, we can state with a high confidence that the precision for $_{92}$U is better compared to that for the best known masses of the uranium isotopes, which is about 1.1 keV. An approximate formula for B_e can be found in the review of Lunney, Pearson and Thibault [10]:

$$B_e(Z) = 14.4381\,Z^{2.39} + 1.55468\times10^{-6}\,Z^{5.35}\,\text{eV}. \quad (2)$$

The atomic masses are given in mass units and the derived quantities in energy units. For the atomic mass unit we use the "unified atomic mass unit", symbol "u", defined as 1/12 of the atomic mass of one ^{12}C atom in its electronic and nuclear ground states and in its rest coordinate system. The energy values are expressed as electron-volt, using the *international* volt V (see discussion in Part I, Section 2).

Due to the dramatic increase in the mass accuracy for some light nuclides, the printing format of the mass table is not adequate for the most precisely known masses, which require additional digits. Table A gives mass excess and atomic mass values for 16 nuclides, whose masses are known with the highest precision, with an uncertainty below 1 eV.

3 Influences on primary nuclides

Table II lists all primary nuclides, together with the main data that contribute to their mass determination (up to the three most important ones) and the *influences* of these data on their masses. It complements the information given in the main table (Part I, Table I) where the *significance* (total *flux*) and the main *flux* of each datum are displayed. In other words, the flow-of-information matrix **F**, defined in Part I, Section 4.3, is (partly) displayed once along lines and once along columns.

4 Nuclear reaction and decay energies

The linear combinations involving neighboring nuclides with small differences in atomic number and mass number, and particles such as n, p, d, t, ^{3}He and α, are important for studies of the trends in the nuclear energy surface and for Q-values of frequently used reactions and decays. In Table III, values for 12 such combinations and their uncertainties are presented.

With the help of the instructions given in the explanation of Table III, values for 28 additional reactions and their uncertainties can be derived. The derived values will be correct, but in a few cases (when reactions involving light nuclei measured with very high precision) the uncertainties will be slightly larger than those obtained when correlations are taken into account.

In cases where any combination of the most precise mass values are involved, the uncertainties can be obtained with the help of the correlation coefficients given in Table B, where the variances and covariances for the most precisely known light nuclei are listed. As an example, if one considers the mass difference between ^{3}H and ^{3}He, it can be easily obtained from the values listed in Table A. However, the corresponding uncertainty cannot be simply determined from the square root of the quadratic sum of the individual uncertainties, which would be:

$$\sqrt{0.081^2+0.060^2}=0.10 \text{ nu}. \quad (3)$$

Since there is a strong correlation between these two nuclides, the uncertainty of the mass difference should be calculated using the correlation information provided in Table B. Thus, its uncertainty can be obtained from the square root of the sum of the variances minus twice the covariance:

$$\sqrt{0.006483+0.003656-2\times 0.003050}=0.064 \text{ nu}. \quad (4)$$

As a result, the final uncertainty is smaller when the correlations are taken into account.

For all other cases, the correlation coefficients are made available at the AMDC websites [11].

5 Graphs of separation and decay energies

All the information contained in the mass table (Table I) and in the nuclear reaction and separation energy table (Table III) can be displayed in plots of the binding energy (or mass) versus Z, N, or A. The atomic mass surface as a function of Z and N splits into four sheets due to the pairing energy, as discussed in Ref. [3]. The even-even sheet lies lowest, the odd-odd highest, and the other two nearly halfway in-between. These sheets are nearly parallel almost everywhere in this three-dimensional space and have remarkably regular trends, as one may convince oneself by making various cuts (e.g. Z or N or A constant). Any derivative of the binding energies also defines four sheets. In this context, *derivative* means a specified difference between the masses of two nearby nuclides. For a derivative specified in such a way where the differences are between nuclides in the same mass sheet, the nearly parallelism of these sheets leads to an almost unified surface for the derivative, thus allowing a single display. The derivatives are also smooth and have the advantage of displaying much smaller variations in data. Therefore, in order to illustrate the regular trends in the mass surface, three derivatives of this last type were chosen:

1. the two-neutron separation energies versus N, with lines connecting the isotopes of a given element (Figs. 1–9);
2. the two-proton separation energies versus Z, with lines connecting the isotones (nuclides with the same number of neutrons) (Figs. 10–17);
3. the Q_α values versus N, with lines connecting the isotopes of a given element (Figs. 18–26).

Clearly showing the trends from the mass surface (TMS), these graphs can be quite useful for checking the quality of any interpolation or extrapolation (if not

too far). When some masses deviate from the regular TMS in a specific mass region, there could be a serious physical cause, like a shell or subshell closure or an onset of deformation. However, if only one mass exhibits an irregular pattern, thus violating the general smooth trends, then one may seriously question the correctness of the related input data.

6 List of references

A complete list of references related to the input data used in the AME2020 and the NUBASE2020 evaluations are presented at the end of this paper. The individual references are given using the "Nuclear Science Reference" (NSR) database [12] keynumbers and identified by the corresponding CODEN style [12]. There is only one exception for the Eur. Phys. A journal, where instead of the 'ZAANE' identifier [12], we have used 'EPJAA'.

EXPLANATION OF TABLE

N	Neutron number.
Z	Proton number.
A	Mass number $A = N + Z$.
Elt.	Element symbol

Orig. Origin of values for secondary nuclides.

zp nn	mass of ${}^{A}Z$ derived from mass of ${}^{A+z+n}(Z+z)$.

Special notations:

IT	when $z = 0, n = 0$;
+	when $z = +1, n = -1$;
−	when $z = -1, n = +1$;
++	when $z = +2, n = -2$;
−−	when $z = -2, n = +2$;
εp	when $z = -2, n = +1$;
$+\alpha$	when $z = +2, n = +2$;
$-\alpha$	when $z = -2, n = -2$;
x	for distant connection.

Mass excess Mass excess [M(in u)−A], in keV, and its uncertainty (one-standard deviation).
In cases where the furthest-left significant digit in the uncertainty was larger than 3, values and uncertainties were rounded off, but not to more than tens of keV. (Examples: $2345.67 \pm 2.78 \rightarrow 2345.7 \pm 2.8, 2345.67 \pm 4.68 \rightarrow 2346 \pm 5$, but $2346.7 \pm 468.2 \rightarrow 2350 \pm 470$).

\# in place of decimal point: value and uncertainty derived not from purely experimental data, but at least partly from TMS (see Part I, Section 5, p. 030002-19).

Binding energy per nucleon Tabulated binding energy per nucleon (in keV):
$B/A = 1/A[ZM({}^{1}\mathrm{H}) + NM(n) - M(A,Z)]$.
and its uncertainty.

\# in place of decimal point: see above.
a in place of uncertainty : uncertainty smaller than 0.5 eV. Full precisions are available in the ASCII format at the AMDC website [12].

Beta-decay energy Direction of decay, value and uncertainty in keV:
for β^-: $Q^- = M(A,Z) - M(A,Z+1)$;
for β^+: $Q^+ = M(A,Z) - M(A,Z-1)$.
For a few odd-odd nuclides near maximum β-stability decaying both β^- and β^+, the Q^+ values are given as negative Q^- values for the preceding even-even isobar.

$*$ in place of value: not calculable.
\# in place of decimal point: see above.
a in place of uncertainty : uncertainty smaller than 0.5 eV. Full precisions are available in the ASCII format at the AMDC website [12] .

Table II. Influences on primary nuclides

EXPLANATION OF TABLE

For each of the 1304 primary nuclides, this table presents up to three most important contributing data and their influences ($\times 100$) on its mass, as determined by the flow-of-information matrix..

Nuclide	Nuclide name (primaries only)			
Influence	*Influence* ($\times 100$) of a particular input data on the mass of a nuclide, as determined by the flow-of-information matrix.			
Equation	K^m, Cs^m, Cs^n, In^p, Tl^q: higher isomers, see NUBASE2020 [2].	In nuclear reactions: ε = electron capture,	In mass-doublet equation: H = ^{1}H, N = ^{14}N, D = ^{2}H, O = ^{16}O, C = ^{12}C, u = absolute mass-doublet.	In mass-triplet equation: Rb^x, Rb^y: different mixtures of isomers or contaminants.

Table III. Nuclear-reaction and separation energies

EXPLANATION OF TABLE

Separation energies (in keV) of particles (or groups of particles) and nuclear-reaction energies obtained as the following combinations of atomic masses (see accompanying diagram) are presented for all nuclides for which such data can be derived:

$$
\begin{array}{lcll}
Q(\beta^-) & = & M(A,Z) - M(A,Z+1) \text{ (in Part I)} & \text{(a)} \\
Q(2\beta^-) & = & M(A,Z) - M(A,Z+2) & \text{(b)} \\
Q(4\beta^-) & = & M(A,Z) - M(A,Z+4) & \text{(c)} \\
Q(\beta^-\text{n}) & = & M(A,Z) - M(A-1,Z+1) - \text{n} & \text{(d)} \\
S(\text{n}) & = & -M(A,Z) + M(A-1,Z) + \text{n} & \text{(e)} \\
S(\text{p}) & = & -M(A,Z) + M(A-1,Z-1) + {}^1\text{H} & \text{(f)} \\
Q(\varepsilon\text{p}) & = & M(A,Z) - M(A-1,Z-2) - {}^1\text{H} & \text{(g)} \\
S(2\text{n}) & = & -M(A,Z) + M(A-2,Z) + 2\text{n} & \text{(h)} \\
Q(\text{d},\alpha) & = & M(A,Z) - M(A-2,Z-1) + {}^2\text{H} - {}^4\text{He} & \text{(i)} \\
S(2\text{p}) & = & -M(A,Z) + M(A-2,Z-2) + 2\,{}^1\text{H} & \text{(j)} \\
Q(\text{p},\alpha) & = & M(A,Z) - M(A-3,Z-1) - {}^4\text{He} + \text{p} & \text{(k)} \\

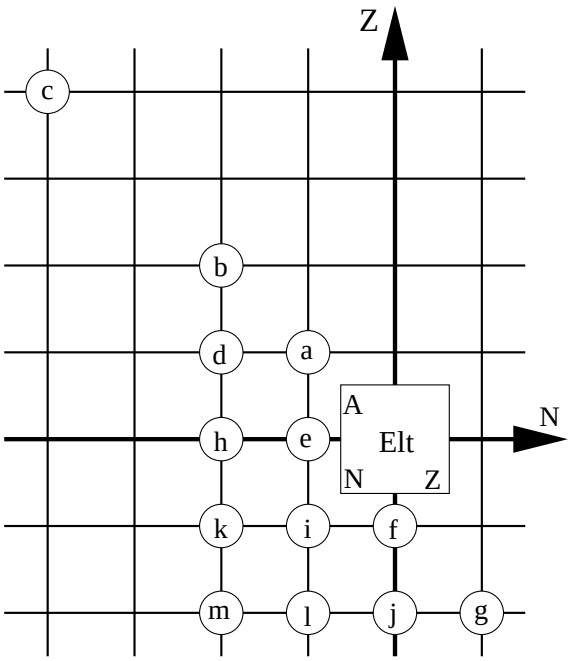
$$



A	Mass number.
Elt.	Element symbol
Z	Atomic number.

2224.57 0.04	2224.57 $\pm$ 0.04 keV. The uncertainties are derived from the adjusted masses and the correlation matrix. The precision of the most-precise values for several light nuclei is often better than 5 eV and they can not be conveniently given in this table. Such values are given in Table A.

$*$	in place of value: not calculable from the present input data.
#	in place of decimal point: values and uncertainties estimated from TMS (see Part I, Section 5, p. 030002-19).
a	in place of uncertainty : uncertainty smaller than 5 eV. Full precisions are available in the ASCII format at the AMDC website [12].

Other reaction energies can be derived from the given data with the help of the following relations:

Graphs of separation and decay energies

Figs.	1– 9.	S_{2n}	two-neutron separation energies.
Figs.	10–17.	S_{2p}	two-proton separation energies.
Figs.	18–26.	Q_α	α-decay energies.

Mass numbers and element symbols are indicated only along the borders of the graphs; those for the intermediate points must be derived by enumeration.

Points represent experimental values.
Open circles represent values estimated from TMS (see Part I, Section 5).

Lines connect points for isotopes (S_{2n}, Q_α) or isotones (S_{2p}).

Other types of graphs are available at the AMDC website [12].
